

Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus which can allow the the one driving to maneuver the forklift without leaving the seat. They are constructed out of high quality materials and are designed to be able to endure the most difficult operations and work surroundings. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate more precise carrying and placement in a quicker and more efficient manner.

The fork pocket is somewhat unique and enables the one operating it to be able to safely swing the forks into position without any worry of destroying the positioning cylinders. This allows the operator the option to perform simultaneous or independent fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into blade positioners on existing units.
